

ContraPest[®]

Enjoy the peace of mind
that your rat infestation
is under control...**fertility control.**

Fertility Control

BRING RAT POPULATIONS DOWN AND KEEP THEM DOWN.

Rats reproduce at an extremely rapid rate, which makes rat infestations challenging to control. ContraPest provides the missing link within your IPM program to prevent population spikes and keep rat populations down.

*When used as directed. Read and follow all label instructions. ContraPest[®] is a Restricted Use Pesticide, due to applicator expertise. Target species: Norway and roof rats.

Looking for long-term success with your IPM program?

ContraPest is the Answer!

Effective

The high fat content and sweet taste of ContraPest is highly attractive to rats, leading to repeated consumption and reduced fertility.*

Targeted Solution

ContraPest is formulated specifically for Norway and roof rats, and the active ingredients metabolize to inactive within 15 minutes, minimizing risk to predatory animals.

Proprietary Delivery System

The delivery system of ContraPest is designed to minimize handler exposure, and is dispensed inside tamper-resistant bait stations, minimizing risks to non-target species.*

Sustainable Population Reduction

Rodent infestations decline as the number of offspring is reduced. With continued consumption, the population remains low, and avoids the rebound effect often seen with the use of lethal pest control products.*

Seamless Deployment

To help fit seamlessly into your IPM protocol we are available for deployment in two bait stations: JT Eaton Rat Fortress (903TP) bait station and BellLabs EVO PROTECTA Express bait station.

*When used as directed. Read and follow all label instructions. ContraPest® is a Restricted Use Pesticide, due to applicator expertise. Target species: Norway and roof rats.

Adding ContraPest showed an additional 46% reduction in rat activity versus a lethal method alone.**

**Protein Production Farm, NC Spring 2015
